

open minded

Can you imagine a digital video recording and management solution without the expense and maintenance of proprietary hardware? We did.

Honeywell's Digital Video Manager (DVM) takes full advantage of open TCP/IP network technologies. Its architecture utilizes your network communications infrastructure - eliminating the need for coaxial cables and providing unmatched camera portability.

DVM allows you to use the commercial off-the-shelf cameras, PC, storage and networking products of your choice – eliminating the need to pay premiums for proprietary hardware. This means you can deliver system hardware and software upgrades as you would with any standard equipment on your network.

Open your mind to the new way of managing video.
